DESIGN OCTAVES

We like to make the inside of your parts look as good as the outside.

Diecut screens can be applied with special conductive tape over louvered openings to fulfill regulatory requirements.

Need EMI/RFI shielding? We're UL certified to apply both nickel base and silver plated copper coatings.

We provide both screen printing and pad printing (for curved surfaces)-ensuring consistent quality and a perfect color match every time. You save time, money and the headaches of addional outsourcing.

Mylar laminates must lay completely flat or they will eventually lft off. We add this tiny paint groove so the paint can't build up in the corners. The mylar lays flat, and stays in place.

Only after careful handwork, is a piece ready for primer & paint. Each part receives as many as six visual inspections. For a critical color match, we can bank your paint to ensure color part after part.

Customer supplied light pipes or custom inserts can be applied without additional outsourcing.

Every part is numbered, date coded & lot numbered. For traceability, we track every part through every phase of our manufacuring process.

If you can imagine it, we can mold it. With complete in-house CNC machining capa-bilies, most molded details are possible.

Molded-in metal inserts can be added to increase rigidity or to provide an appropriate mating surface for attachments and fasteners.

Vents and louvers are no problem with RIM
